Welcome to your CDP Climate Change Questionnaire 2019

C0. Introduction

C0.1

(C0.1) Give a general description and introduction to your organization.

Johnson Matthey is a leader in sustainable technologies. Today, some 87% of the group’s sales represent products and services which provide sustainability benefits through their positive impact on the environment, resource efficiency or our health, as determined by their alignment with the UN SDGs.

Our business is divided into four sectors for reporting purposes, based around the four different applications of our products:
1. Clean Air Sector - catalysts for gasoline and diesel powered vehicles, including hybrids, trucks buses, non-road machinery and stationary equipment
2. Efficient Natural Resources Sector - Catalyst Technologies and additives, licenses process technology and services to the chemical and oil & gas industry; precious metal marketing, distribution, refining and recycling services to a wide variety sectors from chemicals to jewellery; Advanced Glass pastes and enamels primarily for the automotive industry
3. Health Sector - Leading provider of complex chemistry solutions to generic and innovator pharmaceutical companies; develops and manufactures active pharmaceutical ingredients (APIs) for a variety of treatments
4. New Markets Sector - provides battery materials for automotive applications and battery systems for a range of non automotive applications; fuel cell technologies for automotive and stationary applications; Medical Device Components and advanced catalysts derived from precious metals to the pharmaceutical and agricultural chemicals markets

We have operations in over 30 countries and employ around 15,000 people worldwide. Our latest annual integrated report can be found at https://matthey.com/investors/report-archive/annual-report-2019

C0.2

(C0.2) State the start and end date of the year for which you are reporting data.

<table>
<thead>
<tr>

- United States of America

C0.4

(C0.4) Select the currency used for all financial information disclosed throughout your response.
- GBP

C0.5

(C0.5) Select the option that describes the reporting boundary for which climate-related impacts on your business are being reported. Note that this option should align with your consolidation approach to your Scope 1 and Scope 2 greenhouse gas inventory.
- Financial control

C-CH0.7

(C-CH0.7) Which part of the chemicals value chain does your organization operate in?
- Row 1
Bulk organic chemicals

Bulk inorganic chemicals

Other chemicals
Specialty chemicals

C1. Governance

C1.1

(C1.1) Is there board-level oversight of climate-related issues within your organization?
Yes

C1.1a

(C1.1a) Identify the position(s) (do not include any names) of the individual(s) on the board with responsibility for climate-related issues.

<table>
<thead>
<tr>
<th>Position of individual(s)</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chief Executive Officer (CEO)</td>
<td>Our CEO is the executive director on the Board who is responsible for all matters relating to Environment, Health &amp; Safety. He also chairs the Group Management’s Environment, Health and Safety (EHS) Leadership committee which has responsibility for creating a positive EHS culture across the company and monitoring performance against all environmental KPIs, which include targets for CO2 reduction. Annual Report 2019: Page 109 The company director responsible for all our sustainability goals and targets (including our operational carbon footprint target) reports directly to the CEO.</td>
</tr>
</tbody>
</table>

C1.1b

(C1.1b) Provide further details on the board’s oversight of climate-related issues.

<table>
<thead>
<tr>
<th>Frequency with which climate-related issues are a scheduled agenda item</th>
<th>Governance mechanisms into which climate-related issues are integrated</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scheduled – some meetings</td>
<td>Reviewing and guiding strategy</td>
<td>Th Sustainability KPIs to 2025 are scheduled for review once a year by the Board at the summer meeting. Other aspects of climate-related strategy are scheduled for review throughout the year. For more information on which aspects</td>
</tr>
</tbody>
</table>
**C1.2**

(C1.2) Provide the highest management-level position(s) or committee(s) with responsibility for climate-related issues.

<table>
<thead>
<tr>
<th>Name of the position(s) and/or committee(s)</th>
<th>Responsibility</th>
<th>Frequency of reporting to the board on climate-related issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chief Financial Officer (CFO)</td>
<td>Both assessing and managing climate-related risks and opportunities</td>
<td>Half-yearly</td>
</tr>
</tbody>
</table>

The Chief Executive officer chairs and leads a committee called the Group Management Committee. This has responsibility for the executive management of the group's business. Recommends strategic & operating plans to the board.

**C1.2a**

(C1.2a) Describe where in the organizational structure this/these position(s) and/or committees lie, what their associated responsibilities are, and how climate-related issues are monitored (do not include the names of individuals).

The JM board is our highest governance committee. Below this is the GMC (Group Management Committee) chaired by the CEO. This GMC manages climate related matters on behalf of the company and the Chief Financial officer is a member of this committee. They are advised by the Group Strategy director and the Group Assurance and Risk director who both report directly to the Chief Financial Officer. Issues such as climate related risks and opportunities, reporting frameworks, best practice in goal setting, benchmarking, policy development and JM's own goals are reviewed by this committee and action plans agreed. The Group Management's Environment, Health and Safety (EHS) Leadership subcommittee has
responsibility for creating a positive EHS culture across the company and monitoring performance against all environmental KPIs, which include operational targets for CO2 reduction.

**C1.3**

(C1.3) Do you provide incentives for the management of climate-related issues, including the attainment of targets?

Yes

**C1.3a**

(C1.3a) Provide further details on the incentives provided for the management of climate-related issues (do not include the names of individuals).

| Who is entitled to benefit from these incentives? |
| All employees |

| Types of incentives |
| Recognition (non-monetary) |

| Activity incentivized |
| Energy reduction project |

**Comment**

All JM employees are incentivized through the JM employee annual awards. 2 categories of awards allow employees to enter projects / programmes which give operational improvements, energy and carbon savings: (i) Protecting People and Planet and (ii) Innovating and improving: operations

**C2. Risks and opportunities**

**C2.1**

(C2.1) Describe what your organization considers to be short-, medium- and long-term horizons.

<table>
<thead>
<tr>
<th>From (years)</th>
<th>To (years)</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short-term</td>

</tr>
</tbody>
</table>
C2.2

(C2.2) Select the option that best describes how your organization's processes for identifying, assessing, and managing climate-related issues are integrated into your overall risk management.

Integrated into multi-disciplinary company-wide risk identification, assessment, and management processes

C2.2a

(C2.2a) Select the options that best describe your organization's frequency and time horizon for identifying and assessing climate-related risks.

<table>
<thead>
<tr>
<th>Frequency of monitoring</th>
<th>How far into the future are risks considered?</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Row 1</td>
<td>Six-monthly or more frequently</td>
<td>&gt;6 years</td>
</tr>
</tbody>
</table>

C2.2b

(C2.2b) Provide further details on your organization's process(es) for identifying and assessing climate-related risks.

Our risk process is designed to support everyone, at all levels of the business, in identifying and managing risks.

We specifically separate our risk identification efforts into risks within the organisation, and
external risks: we assess combinations of both on delivery of our strategic outcomes. External risks specifically include environmental and climate change risks; our internal risks assess our operations risk, and our procurement risks which include energy. The central Corporate Assurance and Risk team acts as an advisory function and provides independent challenge and review. Each of our business functions also participates in the process, identifying any risks that may prevent them achieving their objectives and describing these in terms of cause and consequence. These are scored using a variety of impact measures taken from our risk library, including financial, operational, reputational and people factors. Controls for each risk are described and assessed. Each risk, at every level, has a designated owner who is responsible for ensuring the described controls are effective and efficient. We continually review the level of risk throughout the business and complete a formal submission every six months for reporting purposes (as illustrated in our risk framework opposite). We have two substantive risks that relate to climate change: Risk 1: "Existing Market Outlook" Under this substantive risk category we assess legislative impacts on our business due to awareness of climate change. This includes both impacts on production costs and attractiveness of our products to the market due to climate-related legislation. Risk 9: “Failure of Operations”: under this substantive risk category we assess the impact of changing weather patterns, availability of water and the probably of extreme weather impacts causing a disruption to production. More information on our risk process and the substantive risks our business faces can be found on pages 91-97 of Annual Report 2019.

C2.2c

(C2.2c) Which of the following risk types are considered in your organization’s climate-related risk assessments?

<table>
<thead>
<tr>
<th>Risk Type</th>
<th>Relevance &amp; inclusion</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current regulation</td>
<td>Relevant, always included</td>
<td>The central Corporate Assurance and Risk team provides a risk library of issues to all businesses to work through and consider at each 6 monthly review. Impact of current regulation is one of the topics in the Risk library.</td>

<td>Relevant, always included</td>
<td>The central Corporate Assurance and Risk team provides a risk library of issues to all businesses to work through and consider at each 6 monthly review. Downstream (factors influencing customer demand for our products) are a crucial part of the topics considered in the risk library.</td>
</tr>
</tbody>
</table>

**C2.2d**

(C2.2d) Describe your process(es) for managing climate-related risks and opportunities.
Each risk has an owner in the business - a senior manager or director who is considered most relevant to identify whether the risk processes are appropriately implemented. The risk owner is required to identify current controls and score likelihood and impact rating of the risk every 6 months. They then determine whether further mitigations are required to reduce the risk and report back to the central Risk Assurance team.

We have two substantive risks that relate to climate change: Risk 1: "Existing Market Outlook" This is a substantive risk in the transitional risks category - we assess legislative impacts on our business due to awareness of climate change. This includes both impacts on production costs and attractiveness of our products to the market due to climate-related legislation and is especially relevant to our products for the automotive industry, where climate concerns is causing a shift from diesel/gasoline powered vehicles to battery electric vehicles. More detail about this risk and how we manage it is given in answer to question C2.3a- Risk 1

Risk 9: “Failure of Operations”: This is in the substantive physical risk category. We assess the impact of changing weather patterns, availability of water and the probably of extreme weather impacts causing a disruption to production at each of our 8 substantive manufacturing locations.

More information on these substantive risks can be found on pages 91-97 of Annual Report 2019.

---

**C2.3**

(C2.3) Have you identified any inherent climate-related risks with the potential to have a substantive financial or strategic impact on your business?

Yes

**C2.3a**

(C2.3a) Provide details of risks identified with the potential to have a substantive financial or strategic impact on your business.

**Where in the value chain does the risk driver occur?**

Customer

**Risk type**

Transition risk

**Primary climate-related risk driver**

Policy and legal: Mandates on and regulation of existing products and services
Type of financial impact
Reduced demand for products and services

Company- specific description
A significant tightening of legislation regulating GHG emissions from vehicles could adversely affect group sales and profitability. For example, introduction of legislation to phase out or ban internal combustion engines (ICE) powered cars over time, in favour of lower emissions alternatives could have a significant impact on JM’s sales of emission control catalysts for light duty vehicles (currently £1.4bn per year). Sentiment around emissions and proposals to ban ICE vehicles for light duty vehicles are currently reducing demand for these products in Europe & China.

Time horizon
Medium-term

Likelihood
Likely

Magnitude of impact
Medium-high

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
1,392,000,000

Potential financial impact figure – minimum (currency)

Potential financial impact figure – maximum (currency)

Explanation of financial impact figure
The potential financial impact figure given is the highest possible eventual annual loss of sales if we do nothing to mitigate the risk. Included in the number is 100% of our revenue from light duty vehicle catalyst sales in Europe and Asia in FY2018/19.

Our Business Strategy assumes diesel share of the market in Europe will gradually decline to around 25% of total light duty vehicles and 20% of cars by 2025. At this level of decline, we do not expect any significant impact on profits. We estimate every 1% point decline in diesel sales in favour of electric vehicles below 25% would impact our gross profit by approximately £4 million. For more information about this risk read our Annual Report 2019 on page 45-46 and our capital markets day 2017 presentation on page 22.

Management method

We continue to aggressively invest in new catalyst technology and battery material technology to meet demand for these products for manufacture of the cleaner vehicles that tightening emissions legislation in Europe is demanding. We have committed to invest £200m CAPEX (starting from mid 2018) to build new manufacturing facilities for 10,000 tonnes per year of Battery Materials, for electric vehicles and purchased land sufficient to support phased expansion to 100,000 tonnes per year as the market demand grows. Commercial production is expected to start in FY2021/22. https://matthey.com/news/2019/johnson-matthey-achieves-two-major-milestones-in-commercialisation-of-eLNO.

We also invest approximately £100m annually in R&D to develop new catalyst technologies for vehicle exhaust systems and battery materials aimed at meeting demand for tightening emissions legislation globally.

We expect that as sales of automotive catalysts decline, sales of components for electric vehicles will increase. Our risk modelling assumes a 6% penetration of pure battery electric vehicles (BEVs) by 2025. We estimate every 1 percentage point increase in market penetration above 6% would impact gross profit by about £7m.

Risk 2

Where in the value chain does the risk driver occur?

Customer

Risk type

Transition risk

Primary climate-related risk driver

Technology: Substitution of existing products and services with lower emissions options

Type of financial impact

Reduced demand for products and services
Company-specific description
Johnson Matthey is a world leader in refining of precious metals and trading precious metals. Currently over half of all precious metals in the marketplace goes into vehicle emissions control systems. Therefore, as demand for petrol and diesel powered vehicles drops in favour of battery-powered electric vehicle in the long term, demand for recycling on precious metals platinum, palladium & rhodium (pgm) refining services could decline. (Growth is expected in the medium term, as more emissions control catalyst enter the End of Life/recycling market).

If on the other hand, fuel cell vehicles, which contain more platinum per vehicle than current ICE technology increases, then demand could increase.

Time horizon
Long-term

Likelihood
More likely than not

Magnitude of impact
Medium

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
281,000,000

Potential financial impact figure – minimum (currency)

Potential financial impact figure – maximum (currency)

Explanation of financial impact figure
The financial impact figure is the highest possible impact on our refining business in the long term without any intervention. It assumes no market for precious metal recycling in the long term. In FY2018/19 Johnson Matthey made sales of £281 million from pgm services, an increase of 11% on the previous year.

PGM services is part of our Efficient Natural Resources sector. Our Business strategy to 2025 assumes that a 10% reduction in pgm price in the future will lead to a reduction of in the region of £5 million in operating profit for this sector, without any mitigation strategy.

Management method
Our long term strategy in the "Efficient Natural Resources sector of our business aims to diversify beyond its historical focus on pgm services. Efficient Natural Resources Market is aiming for leading growth from:
• Focused investment in R&D to maintain and extend technology leadership
• Outperforming in selected, high growth segments
• Increased efficiency to enhance performance
• Extending capabilities into adjacent markets, geographies and technologies.

We spent £40 million in FY2018/19 on R&D in Efficient Natural Resources Sector to diversify our product and services offering in the long term. We also committed to £100m over three years to upgrade one of our refineries to ensure it runs more efficiently and reliably, improving returns in the medium term.

Cost of management
40,000,000

Risk 3

Where in the value chain does the risk driver occur?
Direct operations

Risk type
Physical risk

Primary climate-related risk driver
Acute: Increased severity of extreme weather events such as cyclones and floods

Type of financial impact
Increased insurance claims liability arising from climate-related impacts

Company- specific description
Failure of Significant Site: Potential risks include a disruptive event such as heavy snowfall, hurricane, flood or earthquake, or other weather-related events. The consequences associated with this risk include the impact on our ability to manufacture goods and satisfy customer demand.

Time horizon
Short-term

Likelihood
About as likely as not

Magnitude of impact
Low
**Are you able to provide a potential financial impact figure?**
Yes, a single figure estimate

**Potential financial impact figure (currency)**
50,000,000

**Potential financial impact figure – minimum (currency)**

**Potential financial impact figure – maximum (currency)**

**Explanation of financial impact figure**
The estimated financial implication given in answer to this question is the highest estimated annual loss of sales due to an unexpected failure of one of our largest manufacturing facilities before any mitigation plan is put in place.

**Management method**
We have insurance to cover short term interruptions to production due to extreme weather events and most of our manufacturing facilities are duplicated in more than one country of the world and so in the short term production could be moved to other sites to meet essential demand.
For permanent loss of a facility, we would look to replace the capacity elsewhere by re-building over 3 years, with an associated £50M loss of operating profit and the requirement to work through a working capital uplift.
This annual insurance cover is what is included in the "cost of management" given in this answer.
We have also assessed changes to medium-long term precipitation patterns relative to regional demand and how they could impact on the availability of water for our manufacturing operations in different parts of the world. In 2016 we conducted a new survey using the World Business Council for Sustainable Development (WBCSD) Global Water Tool™ (version 1.3). All our manufacturing sites were included in the assessment. Of the 66 principal sites surveyed, 15 were identified as being in regions of extreme water stress. Our water usage at most of these is very low, however there are four sites that are mains connected and are close to using the available supply per capita: Taloja, India; Yantai, China; New Mexico, US; Brimsdown, UK. We are prioritising water efficiency projects at these sites.

**Cost of management**
15,000,000

Products and services

**Primary climate-related opportunity driver**

Development and/or expansion of low emission goods and services

**Type of financial impact**

Increased revenue through demand for lower emissions products and services

**Company-specific description**

AUTOMOTIVE CATALYSTS FOR TRUCKS/HEAVY-DUTY DIESEL VEHICLES: Johnson Matthey is the world leader in catalyst technology for heavy duty diesel (HDD). We won the Queen's award for Enterprise for inventing and then bringing to market the first HDD emissions control systems and remain well-placed to meet this challenge. This technology enables diesel manufacturers to move to lower CO2 emitting engines without an increase in acid gases (NOx).

New and tighter legislation is already on the statute books across the globe for the next decade and higher demand for HDD vehicles is forecast, particularly in Asia. The new China VI and India VI legislation will impose dramatically higher technical demands on the emission control systems required to produce cleaner exhaust emissions. We expect it to triple the sales value per vehicle for Johnson Matthey.

**Time horizon**

Medium-term

**Likelihood**

Very likely

**Magnitude of impact**

Medium-high
Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
600,000,000

Potential financial impact figure – minimum (currency)

Potential financial impact figure – maximum (currency)

Explanation of financial impact figure
Johnson Matthey's sales to heavy, duty diesel market in 2018 were £141million and the market share was 50%. The total market is expected to grow to over £2billion beyond 2020. If Johnson Matthey maintains a 30% market share, as it does cross automotive catalyst markets globally, this will yield £600 million in sales for JM.

Strategy to realize opportunity
We won the Queen's award for Enterprise for inventing and then bringing to market the first HDD emissions control systems and remain well-placed to meet this challenge. This technology enables diesel manufacturers to move to lower CO2 emitting engines without an increase in acid gases (NOx).
During 2017 our new catalyst manufacturing facilities in Shanghai and Germany came on line to support increased demand for our heavy duty diesel products. We remain well-placed to meet this challenge through investment in R&D and new facilities.

Cost to realize opportunity
162,000,000

Comment
In FY2017/18 we spent £82 million on completing the build of our new manufacturing facilities in our Clean Air business, principally the new manufacturing facilities in Germany and Shanghai. We also spent £80 million in R&D across our automotive catalyst businesses,

Opportunity type
Products and services

Primary climate-related opportunity driver
Development of new products or services through R&D and innovation
Type of financial impact
Better competitive position to reflect shifting consumer preferences, resulting in increased revenues

Company-specific description
BATTERY MATERIALS FOR ZERO EMISSION CARBON AUTOMOTIVE VEHICLES
Additional national greenhouse gas regulations, fuel economy regulations, the creation of "low emission zones" and "clean city" strategies are all likely to encourage the growth of the electric or hybrid vehicle market over the next decade. In 2014 the European Commission has set a goal of 95 grams of carbon dioxide per kilometer (g/km) as an average for all new vehicles sold in Europe from 2020. This is expected to significantly increase the number of battery powered vehicles manufactured in this timeframe. A number of European cities are discussing legislation to ban diesel vehicles from their city centres and incentivising use of electric and hybrid vehicles, which is accelerating growth in this market.

Time horizon
Long-term

Likelihood
Likely

Magnitude of impact
Medium-high

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
100,000,000

Potential financial impact figure – minimum (currency)

Potential financial impact figure – maximum (currency)

Explanation of financial impact figure
This is a highly competitive market and share price sensitive issue. so the figure given here should be taken only as an order of magnitude estimation. We expect the ultra high energy density cathode materials market for electric vehicles to be 500ktonnes - 1800 ktonnes by 2030, with associated sales of $15billion to $54 billion. The estimated value per vehicle to Johnson Matthey will be higher than the current value per vehicle for the autocatalysts market. Therefore we are targeting increased profits of £100m+ for this opportunity beyond 2025.

Strategy to realize opportunity
Johnson Matthey Battery Technologies which specialises in the design, development and manufacture of integrated battery systems was formed in 2013, following the
acquisition of Axeon Ltd in October 2012. Our focus is on the development of battery materials for highly demanding applications such as for the automotive sector. A combination of further acquisitions of specialist technology (two in 2015/16) and investment in internal R&D has grown the business such that sales in 2017 increased by 23% on the previous year. In 2016 we licensed key high nickel intellectual property and in October we announced we had developed a new best-in-class high energy cathode material called eLNO. In October 2017 we publicly announced that we would be investing £200m CAPEX from mid 2018 to scale-up, through demo, pilot and full production scale our novel patented high energy cathode material eLNO. We expect the material to be fully commercialised and on automotive platforms from FY2022/23 onwards.

Primary climate-related opportunity driver

Use of lower-emission sources of energy

Type of financial impact

Returns on investment in low-emission technology

Company-specific description

FUEL CELLS FOR LOW CARBON STATIONARY AND AUTOMOTIVE APPLICATIONS
Fuel cell technology for transport applications, especially cars, remains an important opportunity for Johnson Matthey and major car companies have reaffirmed their interest in fuel cell powertrains as part of a balanced portfolio of electric vehicles. We have continued to develop technology for automotive membrane electrode assemblies and our products have been well received by car companies, providing cost and performance characteristics in line with their needs. The European Commission's new goal of 95 grams of carbon dioxide per kilometer (g/km) as an average for all new vehicles sold in Europe from 2020 is likely to aid the commercialisation of fuel-cell powered vehicle.
Time horizon
Long-term

Likelihood

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
100,000,000

Potential financial impact figure – minimum (currency)

Potential financial impact figure – maximum (currency)

Explanation of financial impact figure
We estimate that £100m + is the incremental revenue opportunity for Johnson Matthey based on fuel cell end markets and hydrogen as an energy vector in the next decade. The details behind this calculation are confidential because they are commercially sensitive.

Strategy to realize opportunity
Johnson Matthey Fuel Cells Ltd was formed in 1999. The company has world class R&D and fuel cell manufacturing facilities and scientists. We work in joint development programs with our key customers (including automotive OEMs) to develop technology suitable for commercialisation. Investment in the technology through internal R&D programs and CAPEX investment in the manufacturing capability of the business, by Johnson Matthey plc, continues on a yearly basis. We are targeting specific markets, customer and geographical opportunities to overcome barriers to widespread commercialisation and adoption this technology faces.

Cost to realize opportunity
10,000,000

Comment
We spend about £10m per year in R&D and CAPEX to realise the opportunity in fuel cell technology. The business itself is now profitable.

C3. Business Strategy

C3.1

(C3.1) Are climate-related issues integrated into your business strategy?
Yes

C3.1a

(C3.1a) Does your organization use climate-related scenario analysis to inform your business strategy?
Yes, quantitative

C3.1c

(C3.1c) Explain how climate-related issues are integrated into your business objectives and strategy.

i. A company-specific explanation of how business objectives and strategy have been influenced by climate-related issues:

Johnson Matthey's Strategy is "to use our world class science to solve customer complex problems. this creates long term value for our shareholders and a cleaner, healthier world" as described in our Annual Report 2019 page 14 -21 : https://matthey.com/investors/report-archive/annual-report-2019

Johnson Matthey runs a detailed, yearly planning and budgeting process for management purposes. As part of this process we explore the evolution of our major markets. We consider potential pathways to meet the 1.5-2C climate change target, netzero legislation and specific country / city restrictions. As an organisation whose activities span automotive, chemicals and raw materials we believe we are well placed to understand legislative evolution and its impact on technology, customer demand and the timing of market evolution (incl., the introduction of disruptive technology). For JM we use these pathways to consider
how our own products and services into these markets will need to evolve along with the investments required to meet future customer demand. Our insights also inform customer and legislator discussions around what transitions and scale of change may be possible and over what timeframes

How our strategy is helping to shaping a new global era of clean energy is described in more detail in on pages 45 -47

Our priority is to be a world leader in selling technology that enables to world to transition to low emission and low carbon transportation:

1. We are a global leader in emissions control technology for diesel powered vehicles that help automakers meet ever tightening CO2 emissions legislation globally, as well as standards for other criteria pollutants (CO, NOx, PM)
2. We are strategically committed to break out growth in the production of battery materials, that will enable superior performance for the next generation of electric vehicles, with IP to support the introduction of market leading cathode technology.
3. We are a world leader in producing PEM fuel cell technologies in support of the transition to a hydrogen economy.

**ii. Explanation of whether your business strategy is linked to an emissions reductions target or energy reduction target:**

Our Business strategy is aligned with the Sustainable Development Goals (SDGs). We have identified 6 SDGs which are supported by our business strategy, one of which is Goal 13: Climate Action. More information about this alignment can be found in our Annual Report 2019 on page 24-25.

We have six quantitative targets for 2025 which are linked to the SDGs and two of them are GHG emissions reductions target linked to SDG goal 13 - Climate Action. Our six goals for 2025 are summarised on pages 24 -25 and their associated quantitative targets are tabulated on page 238.

JM's Goal 5b includes 2 quantitative KPIs to double the impact our products have on reducing the greenhouse gas emissions of our customer. We measure:

i) the tonnes of GHGs removed by our products in use by our customers

ii) the tonnes of GHGs avoided by our customers, when they use our new products, compared to the industry standard.

More about these KPIs and our methodology can be found in Annual Report 2019- pages 44 and 236.

JM's Goal 3 is where we monitor the GHGs of our own operations. We have set a target to reduce the tonnes of greenhouse gases produced by our facilities per tonne product sold by 25% by 2025, from a 2017 baseline. Annual Report 2019 - page 53.
iii. What have been the most substantial business decisions made during the reporting year that have been influenced by the climate change driven aspects of the strategy (e.g. investment, location, procurement, mergers and acquisitions (M&A), research and development (R&D). Both the business decision and the aspect of climate change that has influenced the business decision must be made clear in the answer. If there are none to report, this should be stated:

We have committed to invest £200m CAPEX (starting from mid 2018) to build new manufacturing facilities for 10,000 tonnes per year of Battery Materials for electric vehicles and purchased land sufficient to support phased expansion to 100,000 tonnes per year as the market demand grows. Commercial production is expected to start in FY2021/22.

Our press release in March 2019 states:

"Johnson Matthey (JM), the global leader in science that makes the world cleaner and healthier, announces two major strategic developments in the commercialisation of eLNO®, its portfolio of market-leading ultra-high energy battery cathode materials:

- Site in Poland secured for construction of commercial plant, with room for significant expansion.
- Supply of lithium-containing raw materials secured via a long term supply agreement with Nemaska Lithium Inc. for the supply of lithium hydroxide over ten years to match expanding demands of commercial production.

These two important developments will enable JM to meet customers’ commercial scale requirements for eLNO. They demonstrate that JM is on track with its plans to start commercial production in 2021/22 and to be supplying platforms in production in 2022/23, both of which are in line with our strategy for break out growth in Battery Materials."

The full press release can be found at:

In 2018 we announced six new Sustainable Business KPIs to 2025. Two of these KPI support our ambitions to transition to low carbon operation, both for ourselves and our customers: One goal covers our ambition to transition our own operations to low carbon operation and the second captures our ambition to transform our product portfolio to one that is focussed on low carbon products that are desired by markets wishing to see a global transformation to the low carbon economy.

Goal 3 = "Reduce our greenhouse gas emissions from our own operations per unit production output by 25%"

Goal 5 = "Double the positive impact that JM's products make to a cleaner, healthier world" with separate measures to double the "Number of tonnes of greenhouse (GHGs) gas removed by our products" and "Number of tonnes of greenhouse (GHGs) gas avoided by our products in use".

More information about these KPIs can be found on page 44 and 53 respectively of our Annual Report 2019
C4. Targets and performance

C4.1

(C4.1) Did you have an emissions target that was active in the reporting year?

**Description of product/Group of products**

| JOHNSON MATTHEY OFFERS TECHNOLOGY SOLUTIONS TO AVOID THE USE OF FOSSIL FUELS IN THE TRANSPORTATION SECTOR AND COMBINED HEAT AND POWER, BACKUP POWER SECTOR. We deliver battery cathode materials and fuel cell components for | |

29
electric and hybrid vehicles, stationary energy storage applications. We have developed best-in-class lithium-based cathode materials. Batteries in electric vehicles save GHGs if the electricity used to charge them is more efficient than the combustion engine they are replacing. In cases where renewable electricity is used, the vehicle can become emission free. We are also a world leader in fuel cell technology for generating low carbon power via hydrogen production. Where the hydrogen has been generated from a low-carbon, or where electricity generation becomes more efficient by use of a fuel cell than by burning fossil fuels, GHG emissions are saved.

Are these low-carbon product(s) or do they enable avoided emissions?

Low-carbon product

Taxonomy, project or methodology used to classify product(s) as low-carbon or to calculate avoided emissions
Climate Bonds Taxonomy

% revenue from low carbon product(s) in the reporting year
1.96

Comment
Estimated 216098 tonnes avoided CO2 emissions are based on the use of Johnson Matthey’s LFP materials for automotive applications, as sold in FY 2018/19. Comparisons have been made against equivalent vehicles operating with an internal combustion engine only. Calculations were made using Johnson Matthey’s in-house methodology.

Estimated avoided emissions are based on the use of Johnson Matthey’s fuel cell components for distributed power generation, using natural gas as the source fuel, as sold in FY 2018/19. This excludes any emission savings due to heat recovery. CO2 savings have been calculated using the methodology recommended by the US EPA CHP Partnership, in conjunction
with its Emissions & Generation Resource Integrated Database (eGRID). The displaced grid electricity is based on the national average for fossil fuel output rates over the 2018 calendar year.

Level of aggregation
Product

Description of product/Group of products
JOHNSON MATTHEY OFFERS SERVICES TO ENABLE THE REDUCTION OF NITROUS OXIDE EMISSIONS IN NITRIC ACID PRODUCTION PLANTS. Johnson Matthey supplies pelletised nitrous oxide abatement catalysts through co-operation with Yara International ASA. This is not a Johnson Matthey manufactured product, but a product Johnson Matthey markets and installs on behalf of Yara International ASA. For more information please see: https://matthey.com/products-and-services/precious-metal-products/nitrous-oxide-abatement-catalyst
Are these low-carbon product(s) or do they enable avoided emissions?

Avoided emissions

Taxonomy, project or methodology used to classify product(s) as low-carbon or to calculate avoided emissions

Addressing the Avoided Emissions Challenge - Chemicals sector

% revenue from low carbon product(s) in the reporting year

0.04

Comment

Estimated avoided emissions are based on Johnson Matthey's installations of nitrous oxide abatement catalyst, as operating in FY 2018/19. Calculations were made using the ACM0019 Case 2 methodology of the Clean Development Mechanism, United Nations Framework Convention on Climate Change (UNFCCC).

Purchased goods and services

Evaluation status
Relevant, not yet calculated

Explanation
We have previous reported information in this category from cradle to gate studies of our principle products (4035759 tonnes CO2 reported in FY2017/18). However, this basis for this study is now 5 years old and our portfolio has grown during this time. So we are currently updating the information and plan to report again next year.

Capital goods

Evaluation status
Relevant, not yet calculated

Explanation
We have not yet calculated the carbon footprint our capital goods.

Fuel-and-energy-related activities (not included in Scope 1 or 2)

Evaluation status
Relevant, calculated

Metric tonnes CO2e
22,126

Emissions calculation methodology
Emissions associated with electricity transmission and distribution losses are calculated using location-based emissions factors, purchased and used under license from IEA in November 2018.

Percentage of emissions calculated using data obtained from suppliers or value chain partners
100

Explanation
All our electricity usage information (in GJ or kWh) is obtained directly from our suppliers and taken from bills.

**Upstream transportation and distribution**

<table>
<thead>
<tr>

</tbody>
</table>
We have calculated the production waste footprint of 40% of our key products and found it to be about 0.01% of the total Scope 3 carbon footprint of the products. Therefore, we do not consider production waste to be material in our scope 3 carbon footprint.

### Business travel

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
7,832

**Emissions calculation methodology**
GHG Protocol Corporate Accounting Standard; 2011-12 data provided for JM employee business travel in 2012.

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
0

**Explanation**
We collected data on business travel by employees in 2012 and found it to be only 0.2% of our Scope 3 emissions. Therefore we do not consider it material to our Carbon footprint and have discontinued collecting the data every year. Whilst our operations have grown in size since, it is still likely not material compared to our carbon footprint of direct raw materials. Notwithstanding this, we are currently putting place a method to collect this information centrally in partnership with our business travel services providers and hope to report updated figures next year.

### Employee commuting

**Evaluation status**
Not relevant, calculated

**Metric tonnes CO2e**
90

**Emissions calculation methodology**
2015 UK Defra Guidance/ DECC’s GHG Conversion Factors for Company Reporting of emissions from transportation from https://www.gov.uk/government/collections/government-conversion-factors-for-company-reporting were used to convert miles travelled by different forms of transport into a carbon footprint. The employee commuting footprint was based on results of a travel survey at our largest site in the UK, where 13% of JM employees work. 80% employees reported they came by car; 5% by train and 15% walked/cycled. The number was then scaled up to represent 100% JM employee commuting - assuming commuting habits are similar all JM sites cross the globe. This is unlikely to be the case in detail, but we estimate that it will be an over-estimate, as employees tend to travel longer distances to work in the UK than they do at our other locations.
Percentage of emissions calculated using data obtained from suppliers or value chain partners

0

Explanation
We collected travel information direct from employees, via an in-house survey - not from suppliers.

Upstream leased assets

Evaluation status
Not relevant, explanation provided

Explanation
We don't have any upstream leased assets.

Downstream transportation and distribution

Evaluation status
Not relevant, calculated

Metric tonnes CO2e
200

Emissions calculation methodology
Cradle-to-Gate LCA studies of key products have been carried out according to the requirements of the ISO 14040 and ISO 14044 standards. The carbon footprints were calculated using the IPPC 2007 GWP 100a v1.02 method in SimaPro. The EcoInvent 2.2 database in SimaPro was used to describe the carbon footprint of transportation of products.

Percentage of emissions calculated using data obtained from suppliers or value chain partners

0

Explanation
We have calculated the transportation footprint of several of our key products and found it to be less than 0.01% of the total Scope 3 carbon footprint. Therefore, we do not consider their transportation to be material in our carbon footprint.

Processing of sold products

Evaluation status
Not relevant, explanation provided

Explanation
Our products are not subject to energy-intensive downstream processing. As solid supported catalysts, they are typically manually inserted into metallic containers, which are then either held together with clamps or welded closed.
Use of sold products

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
250,000,000

**Emissions calculation methodology**
Calculations of annual CO2 savings from JM products "in use" in CDM/JI projects were calculated and third-party verified according to the CDM methodology for CER allocation. The impact of catalysts on GHG emissions from a vehicle was measured directly in our engine test facilities. Every vehicle will emit a slightly different mix of GHGs from its engine depending on the fuel used, engine type, car weight and driving style of the driver. Typically, our catalysts convert unburnt hydrocarbons and carbon monoxide in vehicle exhaust into carbon dioxide. This cleans the air but increased the CO2 footprint of the vehicle exhaust slightly. We have taken an average engine out exhaust gas mixture from a mid-size passenger vehicle and assumed 100% conversion of the unburnt hydrocarbons and carbon monoxide by the exhaust emissions control system.

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
0

**Explanation**
This is a partial disclosure. We have so far completed "in-use" LCA studies on approximately 45% of our product portfolio, by sales revenues. Some of JM's products are designed specifically to save GHGs being emitted to atmosphere (e.g. N2O abatement catalysts). Our automotive catalysts create some CO2 whilst they are destroying other environmentally harmful gases and particulates eg. acid gases or photochemical smog in the engine out exhaust gas mixture.

End of life treatment of sold products

**Evaluation status**
Not relevant, explanation provided

**Explanation**
We receive a very high percentage of our precious metal-containing products back to our own factories at End-of-Life. We then recycle them internally, and the emissions associated with this activity are thus included in our Scope 1+2 reporting. Most exceptions to this rule are from our pharmaceutical and medical components businesses where the products are either consumed or remain in the body until death.

Downstream leased assets

**Evaluation status**
Not relevant, explanation provided
Explanation
We do not have any downstream leased assets

Franchises

Evaluation status
Not relevant, explanation provided

Explanation
We do not have any franchises

Investments

Evaluation status
Not relevant, explanation provided

Explanation
We do not generally make investments outside the boundaries of our own business. Manufacturing in joint ventures is included in our scope 1+2 carbon footprint.

Other (upstream)

Evaluation status
Not relevant, explanation provided

Explanation
We do not believe we have anything that fits this category.

Other (downstream)

Evaluation status
Not relevant, explanation provided

Explanation
We do not believe we have anything that fits this category.

C6.7

(C6.7) Are carbon dioxide emissions from biologically sequestered carbon relevant to your organization?
No

C6.10

(C6.10) Describe your gross global combined Scope 1 and 2 emissions for the reporting year in metric tons CO2e per unit currency total revenue and provide any additional intensity metrics that are appropriate to your business operations.
Intensity figure
0.0000385

Metric numerator (Gross global combined Scope 1 and 2 emissions)
414,165

Metric denominator
unit total revenue

Metric denominator: Unit total
10,745,000,000

Scope 2 figure used
Market-based

% change from previous year
11

Direction of change
Decreased

Reason for change
Our absolute carbon footprint dropped by 7% during the year, whilst revenues increased by 5%.

During the year our energy intensity (GJ per tonnes product) decreased by 6% due to energy efficiency improvement projects in our manufacturing facilities. The remaining decrease is due to us switching more of our electricity contracts to zero carbon sources.

NOTE: The way our revenue is calculated has materially changed this year. In Fy2017/18 review was originally reported as £14,122million, but has been re-stated to £10,274million, a drop of 27%. Our re-stated intensity figure for Fy2017/18 is 0.0000403 tonnes/GBP revenue.

---------------------------------------------------------------

Comment

C-CH9.6

(C-CH9.6) Disclose your organization’s low-carbon investments for chemical production activities.

Investment start date
April 1, 2018

Investment end date
March 31, 2019

Investment area
R&D

Technology area
Product redesign
Investment maturity
Applied research and development

Investment figure
120,000,000

Low-carbon investment percentage
81 - 100%

Please explain
Our Gross R&D expenditure across Efficient Natural Resources sector and Clean Air section in FY2018/19 was £120million. The vast majority of R&D activities carried out in Efficient Natural Resources Sector are to design new catalysts & processes that will enable our customers to either run their chemical plants more energy efficiently (i.e. more carbon efficiently). The vast majority of R&D activities carried out in Clean Air sector is to design new higher performing catalysts that will enable our customers (the car manufacturers) to design lower emission and lower CO2 vehicles.

C10. Verification

C10.1

Verification or assurance cycle in place
C10.1b

(C10.1b) Provide further details of the verification/assurance undertaken for your Scope 3 emissions and attach the relevant statements.
C10.2

(C10.2) Do you verify any climate-related information reported in your CDP disclosure other than the emissions figures reported in C6.1, C6.3, and C6.5?

Yes

C10.2a

(C10.2a) Which data points within your CDP disclosure have been verified, and which verification standards were used?

[Checklist]

John Matthey Assurance Statement_Carbon Smart_2019_05_22 v2.0 (002).pdf

C11. Carbon pricing

C11.1

(C11.1) Are any of your operations or activities regulated by a carbon pricing system (i.e. ETS, Cap & Trade or Carbon Tax)?

Yes

C11.1a

(C11.1a) Select the carbon pricing regulation(s) which impacts your operations.

- EU ETS
- UK carbon price floor
- Other carbon tax, please specify
  - UK Carbon Reduction Commitment
C11.1b

(C11.1b) Complete the following table for each of the emissions trading systems in which you participate.

**EU ETS**

<table>
<thead>
<tr>
<th>% of Scope 1 emissions covered by the ETS</th>
<th>4.2</th>

</table>
We have two sites in the UK with CHP that are normally subject to CPS tax under the Carbon floor scheme. However both were switched off for a significant upgrade for the whole of 2018 and so we did not pay any tax during the year.

**Other carbon tax, please specify**

<table>

<tr>
<td>Total cost of tax paid</td>
<td>61,780</td>
</tr>
</tbody>
</table>

**Comment**

**C11.1d**

**(C11.1d) What is your strategy for complying with the systems in which you participate or anticipate participating?**

The EHS Leadership Committee, which reports directly to the Group Management Committee, is responsible for our strategy regards Emission Trading Schemes. It is their responsibility to monitor all existing and forthcoming schemes globally and keep track of which JM sites might be affected by them.

Our strategy for compliance within these schemes is, first & foremost, to reduce our GHG emissions. We will then make up any shortfall between verified emissions and allowances allocated in the most cost-effective way possible.

Our target to reduce our Emissions is encompassed in our Sustainable Business goals to 2025 strategy supports this strategy. Our quantitative targets is:

“To Reduce the carbon footprint of our own operations by 25% per unit production “ by 2025 from a 2017 baseline.

Each site is responsible for its own plan as to how to achieve these targets, and presents their plan to the GMC for approval on an annual basis.

1. We aim to reduce energy consumption through many avenues including installing more efficient equipment and improving the efficiency of our chemical processing. We have many projects running concurrently throughout our sites at any one time towards this objective.
2. Our Royston site is the only one large enough to participate in EU-ETS in the UK. We have a Combined Heat and Power plant on site producing a large proportion of the site’s power needs and it consumes the majority of the Royston site’s natural gas. This plant is part of the CHP Quality Assurance scheme which incentivises efficient electrical production. The CHP plant is Fully Qualified under the CHPQA. From April 2016 we switched to using zero carbon grid electricity at this site, and are now using our on-site CHP generators (which are natural gas powered) less often. This will substantially reduce our carbon emissions from the site in the year ahead.

3. We also use Climate-Change Agreements (CCAs) to minimise our commitment to EU-ETS and CRC. The Royston and Brimsdown sites have agreed to reduce their energy consumption by 11.8% between 2008-2020 under a Climate Change Agreement (CCA)

4. To make up any shortfall between our allocation and verified emissions, we purchase EUAs on the open market, when prices are favourable.

---

**C11.2**

**(C11.2) Has your organization originated or purchased any project-based carbon credits within the reporting period?**

No

**C11.3**

**(C11.3) Does your organization use an internal price on carbon?**

No, and we do not currently anticipate doing so in the next two years

---

**C12. Engagement**

**C12.1**

**(C12.1) Do you engage with your value chain on climate-related issues?**

Yes, our customers

**C12.1b**

**(C12.1b) Give details of your climate-related engagement strategy with your customers.**

---

**Type of engagement**

Collaboration & innovation
Details of engagement

Other – please provide information in column 5

% of customers by number

% Scope 3 emissions as reported in C6.5

0

Please explain the rationale for selecting this group of customers and scope of engagement

We have thousands of customers, large and small. We do not believe it is relevant to calculate "% customers by number" to describe those we work with on projects to combat climate change. We work with most of the world's OEMs on emissions control systems. we work with several on the world's largest chemicals manufacturers too, as shown by the examples below.

Impact of engagement, including measures of success

We work in close partnership with a number of the automotive manufactures (OEMs) to develop new products that will reduce the impact of climate change per vehicle - such as high performance emissions control catalysts for exhausts of ICE vehicles, and high performance cathode materials for battery electric vehicles or fuel cell vehicles. We also work with a number of customers to design new industrial catalysts that enable the use of biofeeds and waste feeds to create chemicals, that would previously have been be manufactured from fossil fuels. for examples see out website.: https://matthey.com/news/2018/jm-and-bp-license-waste-to-fuels-technology-to-fulcrum-bioenergy https://matthey.com/news/2018/hydrogen-refuelling-station-launches-at-johnson-matthey-swindon https://matthey.com/news/2019/bp-partners-with-virent-and-johnson-matthey

C12.3

(C12.3) Do you engage in activities that could either directly or indirectly influence public policy on climate-related issues through any of the following?

Trade associations

C12.3b

(C12.3b) Are you on the board of any trade associations or do you provide funding beyond membership?

Yes
C12.3c

(C12.3c) Enter the details of those trade associations that are likely to take a position on climate change legislation.

Trade association
International Platinum Association

Is your position on climate change consistent with theirs?
Consistent

Please explain the trade association’s position
The IPA is committed to understanding the impact that the precious metal mining and recycling industry has on climate change. It has carried out full LCA studies and published the results of the carbon footprint of these metals. https://ipa-news.com/index/sustainability/

It has recently commissioned an update to this study and Johnson Matthey is fully participating in the project. The IPA seeks to encouraging recycling of all used precious metals in the most climate-friendly manner possible.

How have you influenced, or are you attempting to influence their position?
Johnson Matthey is has a representative on the Board of the IPA and on their Sustainability Committee.

Trade association
Chemical Industry Association (CIA)

Is your position on climate change consistent with theirs?
Consistent

Please explain the trade association’s position
The CIA’s position statement on climate change and UK chemical industry can be found at:  https://www.cia.org.uk/LinkClick.aspx?fileticket=4cajq1pF4l4%3d&portalid=0

CIA opinions and actions:
• There should be early repeal of the UK-only Carbon Price Floor to ensure a level EU playing field. • We need UK and EU Energy markets to work in an integrated and competitive way. Energy policy should be market based, free from interference in price setting with independent economic regulation of natural monopoly networks. • A secure and affordable balance needs to be struck in the generating mix to address the high electricity prices faced by consumers. Sources of low carbon energy should be developed at least cost to consumers and compete for market share. • The UK should maintain its competitive gas market and reduce its import dependency. We should urgently pursue the environmentally safe development of unconventional gas. This
could provide a secure, UK source of chemical feedstock (raw material) as well as fuel. • Energy sources and markets should be connected in a cost effective way and work freely while avoiding policy distortions. Network costs should be reduced to the EU average. We need free and fair access to the EU’s single energy market post-Brexit. • The Energy Intensive Industry (EII) package needs to be maintained and extended to compensate or exempt more businesses from rapidly rising climate policy impacts on electricity prices. • Decarbonisation targets need to be realistic, recognise investment cycles and avoid caps on energy use that prevent growth. • Revisions for Phase 4 of the EU Emissions Trading Scheme need to fully address the risk of production and investment leakage from the EU. • In the light of a hard Brexit, the UK policy mix needs to be rationalised and replace with a single route to 100% exemptions. There should be an effective but lower cost alternative to EU ETS. • And the Chemical Industry Decarbonisation and Energy Efficiency Roadmap Action Plan should be implemented. This includes actions to: increase clustering, support investment in energy efficient technologies, remove of barriers to harnessing waste and bio-resources, fund development of innovative low carbon technologies and deliver an approach to Industrial carbon capture and storage

How have you influenced, or are you attempting to influence their position?
We response to CIA member consultations on the topics relating to climate change matters.

---------------------------------------------
Trade association
The Hydrogen Council

Is your position on climate change consistent with theirs?
Consistent

Please explain the trade association’s position
Hydrogen has the potential to play a significant role in the energy transition. Hydrogen’s high energy density and the fact it allows the clean, long-term storage and transportation of large volumes of energy, make it a viable option in a low carbon society.

Tougher legislation, climate change and an increasing demand for sustainable solutions are accelerating investment in the commercialisation of hydrogen solutions. As such, the Hydrogen Council and its members share the ambition that hydrogen will enable many of the new energy demands that will emerge over the coming decades.

How have you influenced, or are you attempting to influence their position?
Our CEO attended the most recent steering committee of the Hydrogen Council. Afterwards he said, "JM has a great heritage in catalysts and technologies for the large scale production of hydrogen. With the conversation around carbon capture, utilisation and storage (CCUS) now expanded to include hydrogen, we have the technology to enable the TWh of clean hydrogen that will be required to make a difference. And with JM’s investments in fuel cell development, we understand the strengths and weaknesses of the various technologies and can share our expertise with other Council members."

**C12.3f**

(C12.3f) What processes do you have in place to ensure that all of your direct and indirect activities that influence policy are consistent with your overall climate change strategy?

We have senior managers and directors responsible for our memberships of all trade associations. We review our memberships of trade associations annually against our own vision and values, when the membership fees are due. We will cancel membership of any organisation that is not consistent with our own code of conduct or climate change strategy.

**C12.4**

(C12.4) Have you published information about your organization's response to climate change and GHG emissions performance for this reporting year in places other than in your CDP response? If so, please attach the publication(s).
